STORAGE APPLICATION

The policy of the National Plant Germplasm System (NPGS) is that all material deposited in the NPGS will be freely distributed to bonafide scientists for research purposes.

Name of Donor Contact Person T.S. COX Telephone No. (913) 532-7260

Institution or Company USDA-ARS - AGRONOMY DEPT.

Address THROCKMORTON HALL - KANSAS STATE UNIV.

Genus Triticum Species aestivum Common Name wheat ^{Manhattan, KS} ₆₆₅₀₆

Amount Requested: 7,500 seeds for Populations/Synthetics (Cultivar & Germplasm);
5,000 seeds for purelines (Cultivar, Parental Lines, Germplasm, & Genetic Stocks*).
UNTREATED SEED REQUIRED!! *50-100 Seeds for special cytogenetic stocks

Name and/or Number KS92WGRC23 Other Identifiers None

PVP/Patent Applied for or Granted? Yes ☐ No ☒

Reproductive System:

Approximate percent self fertilization under normal field conditions: 99%
Pureline ☒; Population/Synthetic ☐; or Parental
Inbred ☐

Percent Germination determined by Donor — Date of Test —

If genetic stocks, will they require special handling? Yes ☐ No ☒ If yes,
identify contact person who will supply new seed source —
and address —

Material already assigned a PI No.? Yes ☐ No ☒
If yes, give PI No. —

Seed already provided to working collection?

Yes ☐ No ☒ If yes, give date —
location — and amount of
seed —

Year Seed harvested 1992

DESCRIPTIVE INFORMATION - In order for each entry to be properly identified, donors are asked to prepare an abstract and pedigree of each entry. Key features in the abstract might include agronomically important traits such as maturity, plant height (metric terms or dwarf, semi-dwarf, etc.), seed characteristics (size, oil content, milling quality, type, etc.), nutritive value, tolerance to diseases, insects, nematodes, cold, lodging, and others. Give the scientific names of pest organisms. Avoid comparisons with other cultivars or lines unless these are part of the parentage. All accessions deposited at the NSSL will be recorded in the Germplasm Resources Information Network (GRIN) database of the National Plant Germplasm System.

Abstract: (The abstract can be no more than 420 characters in length (7-60 character lines).)

KS92WGRC23 is a leaf rust-resistant, BC₂F₂-derived wheat (*Triticum aestivum*) germplasm derived from a cross between the cultivar Karl and a hybrid between two accessions of *Triticum monococcum*.

Pedigree: (The pedigree should not exceed 240 characters.)

Karl/PI266844/PI355520
